Installation

How to install new package in Python

Example: pip install requests

How to install tensorflow?

python_version = cp27/cp34

sudo pip install

https://storage.googleapis.com/tensorflow/linux/\$device/ten-

How to install Skflow

How to install Keras

update ~/.keras/keras.json - replace "theano" by "tensorflow"

Info

TensorFlow

to 11.5 petaflops.

TensorFlow™ is an open source software library created by Google for numerical computation and large scale computation. Tensorflow bundles together Machine Learning, Deep learning models and frameworks and makes them useful by way of common metaphor.

In May 2017 Google

second-generation of

announced the

TensorFlow the TPU, as well as

the availability of the TPUs in

up to 180 teraflops of perfor-

Google Compute Engine.[12] The

second-generation TPUs deliver

mance, and when organized into

clusters of 64 TPUs provide up

Keras

Keras is an open sourced neural networks library, written in

Python and is built for fast experimentation via deep neural networks and modular design. It is capable of running on top of TensorFlow, Theano, Microsoft Cognitive Toolkit, or PlaidML.

Scikit Flow is a high level interface base on tensorflow which can be used like sklearn. You can build you own model on your own data quickly without rewriting extra code provides a set of high level model classes that you can use to easily integrate with your existing Scikit-learn pipeline code.

Helpers

Python helper Important functions

Get object type

Get help for object (list of available methods, attributes, signatures and so on)

Get list of object attributes (fields, functions)

str(object)

Transform an object to string object?

Shows documentations about the object

Return the dictionary containing the current scope's global variables.

Update and return a dictionary containing the current scope's local variables

Return the identity of an object. This is guaranteed to be unique among simultaneously existing objects.

dir(huiltin)

Other built-in functions

Main classes

TensorFlowClassifier

TensorFlowRegressor

TensorFlowDNNRegressor

Each classifier and regressor have following fields n_classes=0 (Regressor), n_classes are expected to be input (Classifier)

TensorFlowRNNClassifier - there is 50

learning rate=0.1.

Each class has a method fit

fit(X, v, monitor=None, loadir=None

X: matrix or tensor of shape [n samples, n features...]. Can be iterator that returns arrays of features. The training input samples for fitting the model.

Y: vector or matrix [n_samples] or [n_samples, n_outputs]. Can be iterator that returns array of targets. The training target values (class labels in classification, real numbers in

monitor: Monitor object to print training progress and invoke early stopping

logdir: the directory to save the log file that can be used for optional visualization.

predict (X, axis=1, batch_size=None)

X: array-like matrix, [n_samples, n_features...] or iterator. axis: Which axis to argmax for classification.

By default axis 1 (next after batch) is used. Use 2 for sequence

batch_size: If test set is too big, use batch size to split it into mini batches. By default the batch_size member variable is

y: array of shape [n_samples]. The predicted classes or

Variables and Data Types

Variable Assignment

>>> x=5 >>> x

Calculations With Variables

>>> x+2	Sum of two variable
7 >>> x-2	Subtraction of two variable
3 >>> x*7	Multiplication of two variable
10	·
>>> x**2 25	Exponentiation of a variable
>>> x%2	Remainder of a variable
>>> x/float(2)	Division of a variable
2.5	

Calculations With Variables

Variables to strings	'5', '3.45', 'True'	str()
Variables to integers	5, 3, 1	int()
Variables to floats	5.0, 1.0	float()
Variables to booleans	True, True, True	bool()

Asking For Help

>>> help(str)

Lists

Subset

>>> my_list[1]

Also see NumPy Arrays

>>> h = 'nice' >>> my list = ['my', 'list', a, b] >>> my list2 = [[4,5,6,7], [3,4,5,6]]

Selecting List Elements

Select item at index 1

>>> my_list[-3] Select 3rd last item Slice >>> my_list[1:3] Select items at index 1 and 2 Select items after index 0 >>> my_list[1:] >>> my_list[:3] Select items before index 3 >>> my_list[:] Copy my_list Subset Lists of Lists my list[list][itemOfList] >>> my list2[1][0] >>> my list2[1][:2]

List Operations

>>> my_list + my_list ['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice'] >>> mv list * 2 ['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice'] >>> my_list2 > 4

List Methods

Get the index of an item	>>> my_list.index(a)
Count an item	>>> my_list.count(a)
Append an item at a time	>>> my_list.append('!')
Remove an item	>>> my_list.remove('!')
Remove an item	>>> del(my_list[0:1])
Reverse the list	>>> my_list.reverse()
Append an item	>>> my_list.extend('!')
Remove an item	>>> my_list.pop(-1)
Insert an item	>>> my_list.insert(0,'!')
Sort the list	>>> my_list.sort()

Numpy Arrays

Also see Lists

>>> my_list = [1, 2, 3, 4] >>> my_array = np.array(my_list) >>> mv 2darrav = np.array([[1,2,3],[4.5.6]])

Selecting Numpy Array Elements

Index starts at 0

Subset

Select item at index 1 >>> my_array[1]

Slice

>>> my_array[0:2] Select items at index 0 and 1

Subset 2D Numpy arrays

>>> my_2darray[:,0] my 2darray[rows, columns]

Numpy Array Operations

>>> my_array > 3 array([False, False, Fa >>> my_array * 2 array([2, 4, 6, 8]) >>> my_array + np.array([5, 6, 7, 8])
array([6, 8, 10, 12])

Numpy Array Operations

Get the dimensions of the array	>>> my_array.snape	
Append items to an array	>>> np.append(other_array)	
Insert items in an array	>>> np.insert(my_array, 1, 5)	
Delete items in an array	>>> np.delete(my_array,[1])	
Mean of the array	>>> np.mean(my_array)	
Median of the array	>>> np.median(my_array)	
Correlation coefficient	>>> my_array.corrcoef()	
Standard deviation	>>> np.std(my_array)	

Strings

Also see NumPy Arrays

>>> my_string = 'thisStringIsAwesome' >>> my_string

String Operations

>>> my_string * 2 >>> my_string + 'Innit' >>> 'm' in my_string

String Operations

Index starts at

>>> my_string[3] >>> my_string[4:9]

String Methods

>>> my_string.upper() String to uppercase >>> my_string.lower() String to lowercase **Count String elements** >>> my_string.count('w') >>> my_string.replace('e', 'i') Replace String elements >>> my_string.strip() Strip whitespaces

Libraries

Import libraries

>>> import numpy >>> import numpy as np Selective import >>> from math import pi

Python For Data Science Cheat Sheet

PySpark - RDD Basics

BecomingHuman.Al

PySpark is the Spark Python API that exposes the Spark programming model to Python.

Initializing Spark

SparkContext

>>> from pyspark import SparkContext >>> sc = SparkContext(master = 'local[2]')

Calculations With Variables

Retrieve SparkContext version >>> sc.pythonVer Retrieve Python version Path where Spark is installed on >>> str(sc.sparkHome) Retrieve name of the Snark User >>> str(sc.sparkUser()) running SparkContext >>> sc.appName Return application name >>> sc.applicationId Retrieve application ID >>> sc.defaultParallelism Return default level of parallelism >>> sc.defaultMinPartitions Default minimum number of partitions for RDDs

Configuration

>>> from pyspark import SparkConf, SparkContext >>> conf = (SparkConf() setMaster("local") .setAppName("My app") .set("spark.executor.memory", "1q"))

>>> sc = SparkContext(conf = conf)

Configuration

In the PySpark shell, a special interpreter-aware SparkContext is already created in the variable called sc.

\$./bin/spark-shell --master local[2]

\$./bin/pyspark --master local[4] --py-files code.py

Set which master the context connects to with the --master argument, and add Python .zip, .egg or .py files to the runtime path by passing a comma-separated list to --py-files.

Loading Data

Parallelized Collections

>>> rdd = sc.parallelize([('a',7),('a',2),('b',2)]) >>> rdd2 = sc.parallelize([('a',2),('d',1),('b',1)]) >>> rdd3 = sc.parallelize(range(100)) >>> rdd4 = sc.parallelize([("a",["x","y","z"]), ("b",["p", "r"])])

External Data

Read either one text file from HDFS, a local file system or or any Hadoop-supported file system URI with textFile(), or read in a directory of text files with whole Text Files().

>>> textFile = sc.textFile("/my/directory/*.txt") >>> textFile2 = sc.wholeTextFiles("/my/directory/")

Selecting Data

Getting

>>> rdd.collect() Return a list with all RDD elements [('a', 7), ('a', 2), ('b', 2)] >>> rdd.take(2) Take first 2 RDD elements >>> rdd.first() Take first RDD element >>> rdd.top(2) Take top 2 RDD elements Sampling

>>> rdd3.sample(False, 0.15, 81),collect() [3,4,27,31,40,41,42,43,60,76,79,80,86,97

Return sampled subset of rdd3

Filtering

>>> rdd.filter(lambda x: "a" in x) .collect() [('a'.7).('a'.2)] >>> rdd5.distinct().collect() ['a',2,'b',7] >>> rdd.keys().collect()

Filter the RDD Return distinct RDD values Return (key, value) RDD's keys

Iterating

Getting

>>> def g(x): print(x) >>> rdd.foreach(g)

Retrieving RDD Information

Basic Information

>>> rdd.getNumPartitions() List the number of partitions >>> rdd.count() Count RDD instances >>> rdd.countByKey()
defaultdict(<type 'int'>,{'a':2,'b':1}) Count RDD instances by key >>> rdd.countByValue() Count RDD instances defaultdict(<type 'int'>,{('b',2):1,('a',2):1,('a',7):1}) >>> rdd.collectAsMap() Return (key,value) pairs as a >>> rdd3.sum() Sum of RDD elements Sum of RDD elements >>> sc.parallelize([]).isEmpty() Check whether RDD is empty

Summary

>>> rdd3.max() Maximum value of RDD elements >>> rdd3.min() Minimum value of RDD elements Mean value of RDD elements >>> rdd3.mean() >>> rdd3.stdev() 28.866070047722118 Standard deviation of RDD elements >>> rdd3.variance() 833.25 Compute variance of RDD elements >>> rdd3.histogram(3) ([0,33,66,99],[33,33,34]) Compute histogram by bins >>> rdd3.stats() Summary statistics (count, mean,

Reshaping Data

Reducing

>>> rdd.reduceByKey(lambda x,y : x+y) .collect() each key [('a',9),('b',2)] Merge the rdd values for >>> rdd.reduce(lambda a, b: a + b)
('a',7,'a',2,'b',2) Merge the rdd values

Grouping by

>>> rdd3.groupBy(lambda x: x % 2) .mapValues(list) Return RDD of grouped values .collect() >>> rdd.groupByKey() Group rdd by key .mapValues(list) .collect() [('a',[7,2]),('b',[2])]

Aggregating

>>> rdd foldBvKev(f) add)

>>> segOp = (lambda x.v; (x[0]+v,x[1]+1)) Aggregate RDD elements of each partition and then the results >>> comb0p = (lambda x,y:(x[0]+y[0],x[1]+y[1]))Aggregate values of each RDD key >>> rdd3.aggregate((0,0),seqOp,combOp) Aggregate the elements of each 4950 partition, and then the results >>> rdd.aggregateByKey((0,0),seqop,combop) .collect() [('a',(9,2)), ('b',(2,1))] Merge the values for each key >>> rdd3.fold(0.add)

.collect() [('a',9),('b'.2)] >>> rdd3.kevBv(lambda x: x+x) Create tunies of RDD elements by collect() applying a function

Applying Functions

>>> rdd.map(lambda x: x+(x[1],x[0])) Apply a function to each RDD element .collect() [('a',7,7,'a'),('a',2,2,'a'),('b',2,2,b')] >>> rdd5 = rdd.flatMap(lambda x: Apply a function to each RDD x+(x[1],x[0])ent and flatten the result >>> rdd5.collect()
['a',7,7,'a',a',2,2,'a',b',2,2,'b']

>>> rdd4.flatMapValues(lambda x: x) Apply a flatMap function to each (kev.value)pair of rdd4 without .collect() [('a',x'),('a',y'),('a',z'),('b',p'),('b',r')]

Mathematical Operations

>>> rdd.subtract(rdd2) Return each rdd value not contained .collect() in rdd2 [('b',2),('a',7)] >>> rdd2.subtractByKey(rdd) Return each (key, value) pair of rdd2 .collect() [('d', 1)] with no matching key in rdd >>> rdd.cartesian(rdd2).collect() Return the Cartesian product

Sort

>>> rdd2.sortBy(lambda x: x[1]) Sort RDD by given function >>> rdd2.sortByKey() Sort (key, value) RDD by key .collect() [('a',2),('b',1),('d',1)]

Reshaping Data

>>> rdd.repartition(4) New RDD with 4 partitions >>> rdd.coalesce(1) Decrease the number of partitions in the

Saving

>>> rdd.saveAsTextFile("rdd.txt") >>> rdd.saveAsHadoopFile ("hdfs://namenodehost/parent/child", 'org.apache.hadoop.mapred.TextOutputFormat')

Stopping SparkContext

>>> sc.stop()

of rdd and rdd2

Execution

\$./bin/spark-submit examples/src/main/python/pi.py

NumPy Basics Cheat Sheet

BecomingHuman.Al

The NumPy library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

1D array

2D array 3D array axis 2

Creating Arrays

>>> a = np.array([1,2,3]) >>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float) >>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],dtype = float)

Initial Placeholders

>>> np.zeros((3,4))	Create an array of zero
>>> np.ones((2,3,4),dtype=np.int16)	Create an array of one
>>> d = np.arange(10,25,5)	Create an array of evenly space values (step value
>>> np.linspace(0,2,9)	Create an array of even spaced values (number of sample
>>> e = np.full((2,2),7)	Create a constant arra
>>> f = np.eye(2)	Create a 2X2 identity matr
>>> np.random.random((2,2))	Create an array with random value
>>> np.empty((3,2))	Create an empty arra

Saving & Loading On Disk

>>> np.save('my_array', a) >>> np.savez('array.npz', a, b) >>> np.load('my_array.npy')

Saving & Loading Text Files

>>> np.loadtxt("myfile.txt") >>> np.genfromtxt("my_file.csv", delimiter=",') >>> np.savetxt("myarray.txt", a, delimiter=" ")

Inspecting Your Array

>>> a.shape	Array dimensions
>>> len(a)	Length of array
>>> b.ndim	Number of array dimensions
>>> e.size	Number of array elements
>>> b.dtype	Data type of array elements
>>> b.dtype.name	Name of data type
>>> b.astype(int)	Convert an array to a different type

Data Types

Signed 64-bit integer types >>> np.int64 >>> np.float32 Standard double-precision floating point >>> np.complex Complex numbers represented by 128 floats Boolean type storing TRUE and FALSE >>> nn.bool Python object type values >>> np.object Fixed-length string type >>> np.string_ Fixed-length unicode type >>> np.unicode

Asking For Help

>>> np.info(np.ndarray.dtype)

Array Mathematics

Arithmetic Operations

>>> g = a - b array([[-0.5, 0. , 0.], [-3. , -3. , -3.]])	Subtraction
[-3., -3., -3.]]) >>> np.subtract(a,b)	Subtraction
>>> b + a array([[2.5, 4. , 6.], [5. , 7. , 9.]])	Addition
>>> np.add(b,a)	Addition
>>> a / b array([[0.66666667, 1. , 1.], [0.25 , 0.4 , 0.5]])	Division
>>> np.divide(a,b)	Division
>>> a * b array([[1.5, 4. , 9.], [4. , 10. , 18.]])	Multiplication
>>> np.multiply(a,b)	Multiplication
>>> np.exp(b)	Exponentiation
>>> np.sqrt(b)	Square root
>>> np.sin(a)	Print sines of an array
>>> np.cos(b)	Element-wise cosine
>>> np.log(a)	Element-wise natural logarithm
>>> e.dot(f) array([[7., 7.], [7., 7.]])	Dot product

Comparison

Element-wise comparison alse, False]], dtype=bool) >>> a < 2 array([True, False, False], dtype=bool) Element-wise comparison >>> np.array_equal(a, b) Array-wise comparison

Aggregate Functions

>>> a.sum()	Array-wise sum
>>> a.min()	Array-wise minimum value
>>> b.max(axis=0)	Maximum value of an array row
>>> b.cumsum(axis=1)	Cumulative sum of the elements
>>> a.mean()	Mean
>>> b.median()	Median

Copving Arrays

Create a view of the array with the same data >>> h = a.view(>>> np.copy(a) Create a copy of the array >>> h = a.copy() Create a deep copy of the array

Sorting Arrays

>>> a.sort() Sort an array Sort the elements >>> c.sort(axis=0) of an array's axis

Subsetting, Slicing, Indexing

Subsetting		
>>> a[2]	1 2 3	Select the element at the 2nd index
>>> b[1,2] 6.0	1.5 2 3 4 5 6	Select the element at row 1 column 2 (equivalent to b[1][2])
Slicing		
>>> a[0:2] array([1, 2])	1 2 3	Select items at index 0 and 1
>>> b[0:2.1] array([2., 5.])	1.5 2 3 4 5 6	Select items at rows 0 and 1 in column 1
>>> b[:1] array([[1.5, 2., 3.]])	1.5 2 3	Select all items at row 0 (equivalent to b[0:1, :])
>>> c[1,] array([[[3., 2., 1.], [4., 5., 6.]]])	4 5 6	Same as [1,:::]
>>> a[::-1] array([3, 2, 1])		Reversed array a
Boolean Indexing		
>>> a[a<2] array([1])	1 2 3	Select elements from a less than 2
Fancy Indexing		
>>> b[[1, 0, 1, 0],[0, 1, 2, 0]] array([4. , 2. , 6. , 1.5])		Select elements (1,0),(0,1),(1,2) and (0,0)
>>> b[[1, 0, 1, 0]][.[0,1,2,0]] array([[4, .5, .6, .4,],		Select a subset of the matrix's rows and columns

Array Manipulation

Transposing Array

>>> i = np.transpose(b) Permute array dimensions >>> i.T Permute array dimensions

Changing Array Shape >>> b.ravel()

Flatten the array >>> g.reshape(3,-2) Reshape, but don't change data

Adding/Removing Elements

>>> h.resize((2,6)) Return a new array with shape (2,6) >>> np.append(h,g) Append items to an array >>> np.insert(a, 1, 5) Insert items in an array >>> np.delete(a,[1]) Delete items from an array

>>> np.hsplit(a,3) [array([1]),array([2]),array([3])] index

>>> np.vsplit(c,2) Split the array [array([[[1.5, 2., 1.], [4., 5., 6.]]]),

Splitting Arrays

Split the array

>>> np.column_stack((a,d)) array([[1, 10],

>>> np.vstack((a,b))

array([[1. , 2. , 3.], [1.5, 2. , 3.], [4. , 5. , 6.]])

>>> np.hstack((e,f)) array([[7., 7., 1., 0.], [7., 7., 0., 1.]])

>>> np.r_[e,f]

Combining Arrays

>>> np.concatenate((a,d),axis=0) array([1, 2, 3, 10, 15, 20])

>>> np.c_[a,d] Create stacked column-wise arrays

Concatenate arrays

Stack arrays vertically (row-wise)

Stack arrays vertically (row-wise)

Stack arrays horizontally

Create stacked

Bokeh Cheat Sheet

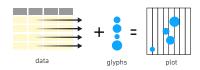

BecomingHuman.Al

Data Types

The Python interactive visualization library Bokeh enables high-performance visual presentation of large datasets in modern web browsers

Bokeh's mid-level general purpose bokeh.plotting interface is centered around two main components; data and glyphs

The basic steps to creating plots with the bokeh.plotting

- 1. Prepare some data:
- Python lists, NumPy arrays, Pandas DataFrames and other sequences of values
- 2. Create a new plot
- 3. Add renderers for your data, with visual customizations
- 4. Specify where to generate the output
- 5 Show or save the results
- >>> from bokeh.plotting import figure >>> from bokeh.io import output_file, show >>> x = [1, 2, 3, 4, 5] >>> v = [6, 7, 2, 4, 5] >>> p = figure(title="simple line example", step 2 x axis label='x'. y_axis_label='y') >>> p.line(x, y, legend="Temp.", line_width=2) <step 3 >>> output file("lines html") sten (>>> show(p) ____step 5

Data

Also see Lists, NumPv & Pandas

Under the hood, your data is converted to Column Data Sources. You can also do this manually:

>>> import numpy as np >>> import pandas as pd >>> df = pd.DataFrame(np.array([[33.9,4,65, 'US'], [32.4,4,66, 'Asia'], [21.4,4,109, 'Europe']]), columns=['mpg',cyl', 'hp', 'origin'], index=['Toyota', 'Fiat', 'Volvo'])

>>> from hokeh models import ColumnDataSource

>>> cds_df = ColumnDataSource(df)

Plotting

>>> from bokeh.plotting import figure >>> p1 = figure(plot_width=300, tools='pan,box_zoom') >>> p2 = figure(plot_width=300, plot_height=300, x_range=(0, 8), y_range=(0, 8)) >>> p3 = figure()

Show or Save Your Plots

>>> show(p1) >>> show(layout) >>> save(p1) >>> save(layout)

Renderers & Visual Customizations

Glyphs

Scatter Markers

>>> p1.circle(np.array([1,2,3]), np.array([3,2,1]), fill color='white') >>> p2.square(np.array([1.5,3.5,5.5]), [1,4,3], color='blue', size=1)

Line Glyphs

>>> p1.line([1,2,3,4], [3,4,5,6], line_width=2) >>> p2.multi line(pd.DataFrame([[1,2,3],[5,6,7]]), pd.DataFrame([[3,4,5],[3,2,1]]),

Rows & Columns Layout

Rows

>>> from bokeh.lavouts import row >>> layout = row(p1,p2,p3)

Columns

>>> from bokeh.layouts import columns >>> layout = column(n1 n2 n3)

Nesting Rows & Columns

>>>layout = row(column(p1,p2), p3)

Grid Lavout

- >>> from bokeh.layouts import gridplot
- >>> row1 = [p1,p2]>>> row2 = [n3]
- >>> layout = gridplot([[p1,p2],[p3]])

Legends

Legend Location

Inside Plot Area

>>> p.legend.location = 'bottom_left'

Outside Plot Area

>>> r1 = p2.asterisk(np.array([1,2,3]), np.array([3,2,1])

>>> r2 = p2.line([1.2.3.4], [3.4.5.6])

>>> legend = Legend(items=[("One", [p1, r1]),("Two", [r2])], location=(0, -30))

>>> p.add_layout(legend, 'right')

Customized Glyphs

Selection and Non-Selection Glyphs

>>> p = figure(tools='box_select' >>> p.circle('mpg', 'cyl', source=cds_df, selection color='re nonselection_alpha=0.1)

Hover Glyphs

>>> hover = HoverTool(tooltips=None, mode='vline') >>> p3.add tools(hover)

Colormapping

>>> color_mapper = CategoricalColorMapper(

factors=['US', 'Asia', 'Europe'],

palette=['blue', 'red', 'green']) >>> p3.circle('mpg', 'cyl', source=cds_df,

color=dict(field='origin',

transform=color_mapper),

legend='Origin'))

Linked Plots

Also see data

Also see data

Linked Axes

>>> p2.x range = p1.x range >>> p2.y_range = p1.y_range

Linked Brushing

>>> p4 = figure(plot_width = 100, tools='box_select,lasso_select')

>>> p4.circle('mpg', 'cyl', source=cds_df)

>>> p5 = figure(plot_width = 200, tools='box_select,lasso_select')

Tabbed Layout

>>> from bokeh.models.widgets import Panel, Tabs

>>> tab1 = Panel(child=p1, title="tab1")

>>> tab2 = Panel(child=p2, title="tab2")

>>> layout = Tabs(tabs=[tab1, tab2])

Legend Orientation

>>> p.legend.orientation = "horizontal"

>>> p.legend.orientation = "vertical"

Legend Background & Border

>>> p.legend.border line color = "navv" >>> p.legend.background_fill_color = "white"

Output

Output to HTML File

>>> from bokeh.io import output file, show >>> output file('my bar chart.html', mode='cdn')

Notebook Output

>>> from bokeh.io import output_notebook, show >>> output notebook()

Standalone HTML

>>> from bokeh.embed import file html >>> html = file html(p, CDN, "my_plot")

Components

>>> from bokeh.embed import components >>> script div = components(n)

Statistical Charts With Bokeh

Also see Data

Bokeh's high-level bokeh.charts interface is ideal for quickly creating statistical charts

>>> from bokeh charts import Bar

>>> p = Bar(df, stacked=True, palette=['red;'blue'])

>>> from bokeh.charts import BoxPlot >>> p = BoxPlot(df, values='vals', label='cyl', legend='bottom_right')

>>> from bokeh.charts import Histogram >>> p = Histogram(df, title='Histogram')

Scatter Plot

>>> from bokeh.charts import Scatter >>> p = Scatter(df, x='mpg', y ='hp', marker='square

xlabel='Miles Per Gallon',

Keras Cheat Sheet

BecomingHuman.Al

Keras is a powerfuland easy-to-use deep learning library for Theano and TensorFlow that provides a high-level neural networks API to develop and evaluate deep learning models.

A Basic Example

>>> import numpy as no

>>> from keras.models import Sequential

>>> from keras.layers import Dense

>>> data = np.random.random((1000.100))

>>> labels = np.random.randint(2,size=(1000,1))

>>> model = Sequential()

>>> model add(Dense(32

input_dim=100))

>>> model.add(Dense(1, activation='sigmoid'))

>>> model.compile(optimizer='rmsprop',

loss='binary crossentropy'.

metrics=['accuracy'])

Data

Also see NumPv. Pandas & Scikit-Learn

Your data needs to be stored as NumPy arrays or as a list of NumPy arrays. Ideally, you split the data in training and test sets, for which you can also resort to the train_test_split module of sklearn.cross_validation.

Keras Data Sets

>>> from keras.datasets import boston_housing, cifar10,

>>> (x train.v train).(x test.v test) = mnist.load data()

>>> (x_train2,y_train2),(x_test2,y_test2) = boston_housing.load data()

Pandas Basics Cheat Sheet

BecomingHuman.Al

Use the following import convention: >>> import pandas as pd

The Pandas library is built on NumPy and provides easy-to-use data structures and data analysis tools for the Python programming language.

Pandas Data Structures

Series

A one-dimensional

labeled array a capable of holding any

>>> s = pd.Series([3, -5, 7, 4], index=['a', 'b', 'c', 'd'])

Data Frame

A two-dimensional labeled data structure with columns of potentially different

>>> data = {'Country': ['Belgium', 'India', 'Brazil'], 'Country': ['Belgium', 'India', 'Brazil'],

'Capital': ['Brussels', 'New Delhi', 'Brasília'],

'Population': [11190846, 1303171035n207847 >>> df = pd.DataFrame(data,

columns=['Country', 'Capital', 'Population'])

Dropping

>>> s.drop(['a', 'c']) >>> df.drop('Country', axis=1)

Drop values from rows (axis=0) Drop values from columns(axis=1)

Sort & Rank

>>> df.sort_index() >>> df.sort_values(by='Country') >>> df.rank()

Sort by labels along an axis Sort by the values along an axis Assign ranks to entries

Sum of values

Retrieving Series/ **DataFrame Information**

>>> df shane (rows.columns) Describe index >>> df index >>> df.columns Describe DataFrame columns >>> df infn() Info on DataFrame >>> df count() Number of non-NA values

Summarv

>>> df.sum() >>> df.cumsum() Cummulative sum of values >>> df.min()/df.max() Minimum/maximum values >>> df.idxmin()/df.idxmax() Minimum/Maximum index value >>> df.describe()

Summary statistics >>> df.mean() Mean of values >>> df median(Median of values

Selection

Also see NumPy Arrays

Getting

>>> s['b'] Get one element >>> df[1:] Get subset of a DataFrame Population Country Capital New Delhi 1303171035

Selecting, Boolean Indexing & Setting

By Position

Select single value by row & >>> df.iloc[[0],[0]] 'Belgium' >>> df.iat([0],[0])

Select single value by row & By Label >>> df.loc[[0], ['Country']]

'Belgium' >>> df.at([0], ['Country']) 'Belgium'

By Label/Position

>>> df.ix[2] Country Capital Brasília Population 207847528 Select a single column of >>> df.ix[:,'Ca 0 Brussels 1 New Delhi 2 Brasília >>> df.ix[1,'Capital']
'New Delhi' Select rows and columns

Boolean Indexing

Series s where value is not >1 >>> s[~(s > 1)] >>> s[(s < -1) | (s > 2)] s where value is <-1 or >2 >>> df[df['Population']>1200000000] Use filter to adjust DataFrame

Setting

Set index a of Series s to 6 >>> s['a'] = 6

Asking For Help

>>> help(pd.Series.loc)

Applying Functions

>>> f = lambda x: x*2 Apply function >>> df.apply(f) >>> df.applymap(f) Apply function element-wise

Data Alignment

Internal Data Alignment

NA values are introduced in the indices that don't overlap:

>>> s3 = pd.Series([7, -2, 3], index=['a', 'c', 'd']) >>> s + s3 a 10.0 b NaN

Arithmetic Operations with Fill Methods

You can also do the internal data alignment yourself with the help of the fill methods:

>>> s.add(s3, fill_value=0) a 10.0 **b -5.0** >>> s.sub(s3, fill value=2) >>> s.div(s3, fill_value=4)

1/0

Read and Write to CSV

>>> pd.read csv('file.csv', header=None, nrows=5) >>> df.to_csv('mvDataFrame.csv')

Read and Write to Excel

>>> pd.read excel('file.xlsx')

>>> pd.to_excel('dir/myDataFrame.xlsx', sheet_name='Sheet1')

Read multiple sheets from the same file

>>> xlsx = pd.ExcelFile('file.xls') >>> df = pd.read excel(xlsx, 'Sheet1')

Read and Write to SQL Query or Database Table

>>> from sqlalchemy import create_engine

>>> engine = create_engine('sqlite:///:memory:')

>>> pd.read_sql("SELECT * FROM my_table;", engine)

>>> pd.read_sql_table('my_table', engine)

>>> pd.read sql_query("SELECT * FROM my_table;", engine)

read sql()is a convenience wrapper around read sql table() and read_sql_query()

>>> pd.to_sql('myDf', engine)

Data Wrangling with pandas Cheat Sheet

Syntax Creating DataFrames

	a	b	С
1	4	7	10
2	5	8	11
3	6	9	12

df = pd.DataFrame({"a" : [4 ,5, 6], "b": [7, 8, 9]. "c":[10, 11, 12]},

index = [1, 2, 3]) Specify values for each column.

df = nd DataFrame([[4, 7, 10], [5, 8, 11], [6. 9. 12]]. index=[1, 2, 3], columns=['a', 'b', 'c']) Specify values for each row

		a	b	С
n	v			
	1	4	7	10
d	2	5	8	11
е	2	6	9	12

df = pd.DataFrame({"a":[4,5,6], "b":[7.8.9]. "c" : [10, 11, 12]}. index = pd.MultiIndex.from_tuples([('d',1),('d',2),('e',2)], names=['n''v']))

Create DataFrame with a MultiIndex

Method Chaining

Most pandas methods return a DataFrame so that another pandas method can be applied to the result. This improves readability of code. df = (pd.melt(df))

.rename(columns={ 'variable' · 'var' 'value' : 'val'}) .query('val >= 200')

Windows

df.expanding()

Return an Expanding object allowing summary functions to be applied cumulatively.

df.rolling(n)

Return a Rolling object allowing summary functions to be applied to windows of length n.

Windows

df nlot hist() Histogram for each column

df plot scatter(x='w' v='h') Scatter chart using pairs of noints

BecomingHuman.Al Tidy Data A foundation for wrangling in pandas

Fach variable Fach observation

is saved in its

own column

data set:

vectorized operations. pandas will automatically preserve observations as you manipulate variables. No other format works as intuitively with pandas

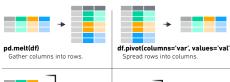

Tidy data complements pandas's

Reshaping Data Change the layout of a data set

is saved in its

own row

df.sort values('mpg')

Order rows by values of a column (low to high)

df.sort_values('mpg',ascending=False) Order rows by values of a column (high to low).

df.rename(columns = {'y':'year'}) Rename the columns of a DataFrame

df.sort index()

Sort the index of a DataFrame

df reset index()

Reset index of DataFrame to row numbers moving index to columns.

df.drop(columns=['Length','Height'])

Subset Observations (Rows

Append columns of DataFrames

df[df.Length > 7]Extract rows that meet

logical criteria.

Append rows of DataFrames

df.drop duplicates()

Remove duplicate rows (only considers columns)

df.head(n)

Select first n rows

df tail(n) Select last n rows

df.sample(n=10)

Randomly select n rows.

of rows

df.iloc[10:20] Select rows by position

df sample(frac=0.5)

Randomly select fraction

df.nlargest(n. 'value')

Select and order top n entries

df.nsmallest(n, 'value') Select and order bottom

		ogic ili Pytiloli (aliu j	rython (and pandas)		
	<	Less than	!=	Not equal to	
	>	Greater than	df.column.isin(values)	Group membership	
	==	Equal to	pd.isnull(obj)	Is NaN

_	>=	Greater than or equal to	&, ,~,^,df.any(),df.all(Logical and, or, not,	
				vor any all	

agg(function)

Size of each group. Aggregate group using function.

Subset Variables (Columns

df[['width','length','species']]

Select multiple columns with specific names

df['width'] or df.width

Select single column with specific name.

df.filter(regex='regex')

Select columns whose name matches regular expression regex

Logic in Python (and pandas)

Matches strings containing a period

Matches strings ending with word 'Length'
Matches strings beginning with the word 'Sepal'
Matches strings beginning with 'x and ending with 1,2,3,4,5
Matches strings except the string 'Species' 'Length\$ '^Sepal' '^x[1-5]\$'

Select all columns between x2 and x4 (inclusive).

df.iloc[:.[1.2.5]]

Select columns in positions 1, 2 and 5 (first column is 0).

df.loc[df['a'] > 10, ['a','c']]

Select rows meeting logical condition, and only the specific columns

Summarise Data

df['w'].value_counts()

Count number of rows with each unique value of variable

len(df)

of rows in DataFrame.

df['w'].nunique()

of distinct values in a column

df.describe()

Basic descriptive statistics for each column (or GroupBy)

pandas provides a large set of summary functions that operate on different kinds of pandas objects (DataFrame columns Series GroupRy Expanding and Rolling (see below)) and produce single values for each of the groups. When applied to a DataFrame the result is returned as a pandas Series for each column Examples:

count()

median()

Median value of

Sum values of each object.

min() Minimum value in each object.

Count non-NA/null

values of each object

each object. quantile([0.25.0.75])

apply(function) Apply function to each object

max()

Maximum value in each object

mean() Mean value of each object

var() Quantiles of each object Variance of each object

std()

Standard deviation of each object.

Handling Missing Data

Drop rows with any column having NA/null data.

Make New Columns

df assign(Area=lambda df: df Length*df Height) Compute and annead one or more new column

df['Volume'] = df.Length*df.Height*df.Depth

pd.qcut(df.col, n, labels=False) Bin column into n buckets

pandas provides a large set of vector functions that operate on allcolumns of a DataFrame or a single selected column (a pandas Series). These functions produce vectors of values for each of the columns, or a single Series for the individual Series, Examples:

max(axis=1)

Flement-wise max

clip(lower=-10,upper=10) Trim values at input thresholds

min(axis=1) Flement-wise min

Vector

abs() Absolute value

Combine Data Sets

B 2 Rows that appear

Rows that appear in both ydf and zdf

Rows that appear in either or both ydf and zdf

x1 x2 A 1

pd.merge(ydf, zdf, how='outer', .query('_merge == "left_only"')

Rows that appear in ydf but not zdf (Setdiff)

.drop(columns=['_merge'])

The examples below can also be applied to groups. In this case, the function is applied on a per-group basis, and the

Cumulative min cumprod()

cummin()

Cumulative product

pd.merge(ydf, zdf, how='outer')

Windows

Additional GroupBy functions

df.groupby(by="col")

Return a GroupBy object, grouped by values in column named "col"

df.groupby(level="ind") Return a GroupBy object, grouped by values in index level named "ind".

All of the summary functions listed above can be applied to a group.

shift(1) Copy with values shifted by 1

returned vectors are of the length of the original DataFrame

rank(method='dense') Ranks with no gaps. rank(method='min') Ranks. Ties get min rank. rank(nct=True)

Ranks rescaled to interval [0, 1]

rank(method='first') Ranks. Ties go to first value. shift(-1)

Copy with values lagged by 1. cumsum() Cumulative sum cummax() Cumulative max

adf x1 x2 A 1 B 2 C 3 x1 x2 x3 dpd.merge(adf, bdf, how='left'. on='x1') Join matching rows from bdf to adf. x1 x2 x3 nd merge(adf hdf how='right' on='x1') Join matching rows from adf to bdf pd.merge(adf, bdf. how='inner', on='x1') B 2 F Join data. Retain only rows in both sets x1 x2 x3 pd.merge(adf, bdf, how='out how='outer'. on='x1') Join data Retain all values all rows **Filtering Joins** adf[adf.x1.isin(bdf.x1)] All rows in adf that have a match in bdf. adf[~adf.x1.isin(bdf.x1)] x1 x2 All rows in adf that do not have a match in bdf

Creative Commons Data Wrangling with Pandas by RStudio is licensed under CC BY SA 4.0

Data Wrangling with dplyr and tidyr **Cheat Sheet**

BecomingHuman.Al

Syntax Helpful conventions for wrangling

dplvr::tbl df(iris)

Converts data to thi class, this are easier to examine than data frames. R displays only the data that fits onscreen

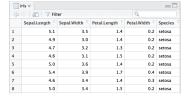

Source: local data frame [150 x 5] Sepal.Length Sepal.Width Petal.Length 4.9 3.0 1.4 4.7 3.2 1.3 4.6 3.1 1.5 5.0 3.6 Variables not shown: Petal.Width (dbl).

Species (fctr) dplyr::glimpse(iris)

Information dense summary of tbl data.

utils::View(iris)

View data set in spreadsheet-like display (note capital V)

dplvr::%>%

Passes object on lef hand side as first argument (or argument) of function on righthand side.

x %>% f(y) is the same as f(x, y)v %>% f(x, .. z) is the same as f(x, v, z)

"Piping" with %>% makes code more readable, e.g.

iris %>%

group_by(Species) %>% summarise(avg = mean(Sepal.Width)) %>% arrange(avg)

Tidy Data A foundation for wrangling in R

In a tidy data set:

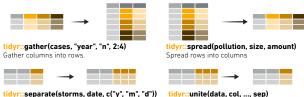

Reshaping Data Change the layout of a data set

dplvr::data frame(a = 1:3, b = 4:6)Combine vectors into data frame (optimized).

dplyr::arrange(mtcars, mpg) Order rows by values of a column (low to high)

dplvr::arrange(mtcars, desc(mpg)) Order rows by values of a column (high to low)

dplyr::rename(tb, y = year) Rename the columns of a data frame

Subset Observations (Rows

dplyr::filter(iris, Sepal.Length > 7)

Extract rows that meet logical criteria

separate(storms, date, c("y", "m", "d")

dplyr::distinct(iris)

Remove dunlicate rows

dplyr::sample_frac(iris, 0.5, replace = TRUE) Randomly select fraction of rows

dplyr::sample_n(iris, 10, replace = TRUE)

Randomly select n rows dplyr::slice(iris, 10:15)

Select rows by position

dplyr::top_n(storms, 2, date)

Select and order top n entries (by group if grouped data).

	Logic in R - ?	Comparison, ?base	::Logic
<	Less than		Not equal to
>	Greater than	%in%	Group membership
	Equal to	is.na	Is NA
<=	Less than or equal to	!is.na	Is not NA
>=	Greater than or equal to	&, ,!,xor,any,all	Boolean operators

Subset Variables (Columns

dplyr::select(iris, Sepal.Width, Petal.Length, Species)

Select columns by name or helper function.

select(iris, contains("."))

Unite several columns into one

Select columns whose name contains a character string.

select(iris, ends with("Length"))

Select columns whose name ends with a character string

select(iris, everything()) Select every column.

select(iris, matches(".t."))

Select columns whose name matches a regular expression

select(iris, num_range("x", 1:5))

Select columns named x1, x2, x3, x4, x5,

select(iris, one_of(c("Species", "Genus"))) Select columns whose names are in a group of names.

select(iris, starts_with("Sepal"))

Select columns whose name starts with a character string.

select(iris Senal Length Petal Width

Select all columns between Sepal.Length and Petal.Width (inclusive).

select(iris, -Species)

Select all columns except Species.

Group Data

dplyr::group by(iris, Species) iris %>% group_by(Species) %>% summarise(...)

Group data into rows with the same value of Species.

dplyr::ungroup(iris) Remove grouping information

from data frame.

iris %>% group_by(Species) %>% mutate(...)

Summarise Data

dplyr::summarise(iris, avg = mean(Sepal.Length))

Summarise data into single row of values

dplyr::summarise_each(iris, funs(mean)) Apply summary function to each column.

dplyr::count(iris, Species, wt = Sepal.Length)

Count number of rows with each unique value of variable (with or without weights).

Summarise uses summary functions, functions that take a vector of values and return a single value. such as:

dplvr::first

First value of a vector dplyr::last

Last value of a vector

dplyr::nth

Nth value of a vector. dnlyr"n

of values in a vector dplyr::n_distinct

of distinct values in a vector.

IOR of a vector

Minimum value in a vector

Maximum value in a vector.

mean

Mean value of a vector. median

Median value of a vector

Variance of a vector.

Ranks. Ties got to first value. dplyr::ntile Standard deviation of a

Bin vector into n buckets

dplyr::between Are values between a and b?

Ranks with no gans

dplyr::percent rank

dplyr::row_number

Ranks rescaled to [0, 1]

Ranks. Ties get min rank

dplyr::min rank

dplyr::cume_dist Cumulative distribution

Make New Variables

Compute and append one or more new columns dplyr::mutate_each(iris, funs(min_rank))

Apply window function to each column

dplyr::transmute(iris, sepal = Sepal.Length + Sepal. Width)

Compute one or more new columns, Drop original columns

Mutate uses window functions, functions that take a vector of values and return another vector of values, such as:

dplvr::lead

Copy with values shifed by 1. Cumulative all dplvr::lag dplvr::cumany

Copy with values lagged by 1 Cumulative any dplyr::dense rank

dplyr::cummean Cumulative mean

cumsum Cumulative sum

cummax Cumulative max

cummin Cumulative min

cumprod Cumulative prod

Element-wise max

Element-wise min

Combine Data Sets

vector

Mutating Joins

x1 x2 x3 dplyr::lef_join(a, b, by = "x1")

B 2 F Join matching rows from b to a Join matching rows from b to a. dplyr::right_join(a, b, by = "x1") Join matching rows from a to b.

dplyr::inner_join(a, b, by = "x1") Join data. Retain only rows in both sets. dplyr::full ioin(a, b, by = "x1")

A 1 T B 2 F C 3 NA Join data, Retain all values, all rows

dplyr::semi_join(a, b, by = "x1")
A 1
B 2
All rows in a that have a match in

All rows in a that have a match in b.

x1 x2 dplyr::anti_join(a, b, by = "x1") All rows in a that do not have a match in b

Set Operations

x1 x2 dplyr::intersect(y, z) B 2 Rows that appear in both y and z.

x1 x2 dplyr::union(y, z) Rows that appear in either or both y and z.

Rows that appear in y but not z.

x1 x2 dplyr::setdiff(y, z)

Append z to y as new rows.

31 32 31 32 dplyr::bind cols(v, z)

A 1 B 2
B 2 C 3
C 3 D 4 Caution: matches rows by position.

Interacting With NumPy

Also see NumPy

>>> import numpy as np >>> a = np.array([1,2,3]) >>> b = np.array([(1+5j,2j,3j), (4j,5j,6j)])>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]])

Index Tricks

>>> np.mgrid[0:5,0:5]	Create a dense meshgrid
>>> np.ogrid[0:2,0:2]	Create an open meshgrid
>>> np.r_[3,[0]*5,-1:1:10j]	Stack arrays vertically (row-wise)
>>> np.c_[b,c]	Create stacked column-wise arrays

Shape Manipulation

Permute array dimensions	>>> np.transpose(b)
Flatten the array	>>> b.flatten()
Stack arrays horizontally (column-wise)	>>> np.hstack((b,c))
Stack arrays vertically (row-wise)	>>> np.vstack((a,b))
Split the array horizontally at the 2nd index	>>> np.hsplit(c,2)
Split the array vertically at the 2nd index	>>> np.vpslit(d,2)

Polynomials

>>> from numpy import poly1d >>> p = poly1d([3,4,5])

Create a polynomial object

Vectorizing Functions

>>> def mvfunc(a): if a < 0: return a*2 else: return a/2

>>> np.vectorize(myfunc) Vectorize functions

Type Handling

Return the real part of the array elements >>> np.imag(b>>> Return the imaginary part of the array elements np.real if close(c,tol=1000) Return a real array if complex parts close to 0 >>> np.cast['f'](np.pi) Cast object to a data type

Other Useful Functions

>>> np.angle(b,deg=True)	Return the angle of the complex argumen
>>> g = np.linspace(0,np.pi,num=5	Create an array of evenly spaced values (number of samples
>>> g [3:] += np.pi	(number of samples
>>> np.unwrap(g)	Unwrap
>>> np.logspace(0,10,3)	Create an array of evenly spaced values (log scale
>>> np.select([c<4],[c*2])	Return values from a list of arrays depending on conditions
>>> misc.factorial(a)	Factoria
>>> misc.comb(10,3,exact=True)	Combine N things taken at k time
>>> misc.central_diff_weights(3)	Weights for Np-point central derivative

>>> misc.derivative(mvfunc.1.0) Find the n-th derivative of a function at a point

Linear Algebra

You'll use the linalg and sparse modules. Note that scipy.linalg contains and expands on numpy.linalg

>>> from scipy import linalg, sparse

Creating Matrices

>>> A = np.matrix(np.random.random((2.2))) >>> B = np.asmatrix(b) >>> C = np.mat(np.random.random((10,5))) >>> D = np.mat([[3.4], [5.6]])

Racic Matrix Poutings

Inverse	
>>> A.I	Inverse
>>> linalg.inv(A)	Inverse
Transposition	
>>> A.T	Tranpose matrix
>>> A.H	Conjugate transposition
Trace	
>>> np.trace(A)	Trace
Norm	
>>> linalg.norm(A)	Frobenius norm
>>> linalg.norm	L1 norm (max column sum)
>>> linalg.norm(A,np.inf)	L inf norm (max row sum)
Rank	
>>> np.linalg.matrix_rank(C)	Matrix rank
Determinant	

Solving linear problems

>>> linalq.solve(A,b) Solver for dense matrices >>> E = np.mat(a).T Solver for dense matrices >>> linalg.lstsq(F,E) Least-squares solution to linear matrix

Generalized inverse

>>> F = np.eve(3, k=1)

>>> linalg.pinv(C) Compute the pseudo-inverse of a matrix (least-squares solver) >>> linalg.pinv2(C) Compute the pseudo-inverse of a matrix (SVD)

Create a 2X2 identity matrix

Identify sparse matrix

Creating Matrices

>>> sparse.isspmatrix csc(A)

>>> G = np.mat(np.identity(2)) Create a 2x2 identity matrix >>> C[C > 0.5] = 0 >>> H = sparse.csr matrix(C) Compressed Sparse Row matrix >>> I = sparse.csc matrix(D) Compressed Sparse Column matrix >>> J = sparse.dok matrix(A) Dictionary Of Keys matrix >>> F todense() Sparse matrix to full matrix

Matrix Functions Addition

>>> np.add(A,D)	Addition
Subtraction	
>>> np.subtract(A,D)	Subtraction
Division	
>>> np.divide(A,D)	Division
Multiplication	
>>> A @ D	Multiplication operator (Python 3)
>>> np.multiply(D,A)	Multiplication
>>> np.dot(A,D)	Dot product
>>> np.vdot(A,D)	Vector dot product
>>> np.inner(A,D)	Inner product
>>> np.outer(A,D)	Outer product
>>> np.tensordot(A,D)	Tensor dot product
>>> np.kron(A,D)	Kronecker product

Exponential Functions

>>> linalg.expm(A)	Matrix exponential
>>> linalg.expm2(A)	Matrix exponential (Taylor Series)
>>> linalg.expm3(D)	Matrix exponential (eigenvalue decomposition)

Logarithm Function

Trigonometric Functions

Matrix sine	>>> linalg.sinm(D)
Matrix cosine	>>> linalg.cosm(D)
Matrix tangen	>>> linalg.tanm(A)

Hyperbolic Trigonometric Functions

>>> linalg.sinhm(D)	Hypberbolic matrix sine
>>> linalg.coshm(D)	Hyperbolic matrix cosine
>>> linalg.tanhm(A)	Hyperbolic matrix tangent

Matrix Sign Function

>>> np.signm(A)	Matrix sign function
Materia Communic Donat	

Arbitrary Functions

>>> linalq.funm(A, lambda x: x*x)

Evaluate matrix function

Sparse Matrix Routines

Inverse	
>>> sparse.linalg.inv(I)	Invers
Norm	
>>> sparse.linalg.norm(I)	Norr
Solving linear problems	
>>> sparse.linalg.spsolve(H.I)	Solver for sparse matrice

Sparse Matrix Functions

Sparse matrix exponential >>> sparse.linalg.expm(I)

Decompositions

Eigenvalues and Eigenvectors

>>> ta, v = tinatg.eig(A)	Solve ordinary or generalized
>>> l1, l2 = la	eigenvalue problem for square matrix
>>> v[:,0]	First eigenvector
>>> v[:,1]	Second eigenvector
>>> linalq.eiqvals(A)	Unpack eigenvalues

Singular Value Decomposition Halle Haller and (D)

> U,s,Vh = linalg.svd(B)	Singular Value Decomposition (SVD)
> M,N = B.shape	
> Sig = linalg.diagsvd(s,M,N)	Construct sigma matrix in SVD

LU Decomposition

>>> P.L.U = linalg.lu(C) LU Decomposition

Sparse Matrix Decompositions

>>> la, v = sparse.linalg.eigs(F,1) Eigenvalues and eigenvectors >>> sparse.linalg.svds(H. 2)

Asking For Help

>>> help(scipy.linalg.diagsvd)

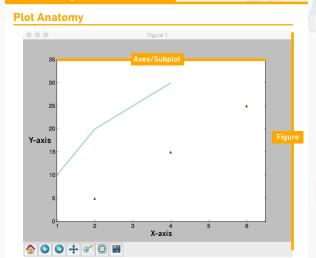

>>> np.info(np.matrix)

Matplotlib is a Python 2D plotting library which produces publication-quality figures in a variety of hardcopy formats and interactive environments across platforms.

Matplotlib Cheat Sheet

BecomingHuman.Al

Anatomy & Workflow

Workflow

Prepare data

Customize plot

Create plot

Plot

Show plot

>>> import matplotlib.pyplot as plt >>> x = [1,2,3,4] >>> y = [10,20,25,30] >>> fig = plt.figure() >>> ax = fig.add subplot(111) >>> ax.plot(x, y, color='lightblue', linewidth=3) >>> ax.scatter([2,4,6], [5.15,25], >>> ax.set xlim(1, 6.5) >>> plt.savefig('foo.png' >>> plt.show()

Prepare The Data

Also see Lists & NumPv

Index Tricks

>>> import numpy as np >> x = np.linspace(0.10.100)

>>> y = np.cos(x)

>> z = np.sin(x)

2D Data or Images

>>> data = 2 * np.random.random((10, 10))

>>> data2 = 3 * np.random.random((10, 10))

>>> Y, X = np.mgrid[-3:3:100j, -3:3:100j] >>> U = -1 - X**2 + Y

>>> V = 1 + X - Y**2

>>> from matplotlib.cbook import get_sample_data

>>> img = np.load(get_sample_data('axes_grid/bivariate_normal.npy'))

Create Plot

>>> import matplotlib.pyplot as plt

Figure

>>> fig = plt.figure()

>>> fig2 = plt.figure(figsize=plt.figaspect(2.0))

Axes

All plotting is done with respect to an Axes. In most cases, a subplot will fit your needs. A subplot is an axes on a grid system.

>>> fig.add_axes()

>>> ax1 = fig.add_subplot(221) # row-col-num

>>> ax3 = fig.add_subplot(212)

>>> fig3, axes = plt.subplots(nrows=2,ncols=2)

>>> fig4, axes2 = plt.subplots(ncols=3)

Customize Plot

Colors, Color Bars & Color Maps

>>> plt.plot(x, x, x, x**2, x, x**3)

>>> ax.plot(x, y, alpha = 0.4)

>>> ax.plot(x, y, c='k')

>>> fig.colorbar(im, orientation='horizontal')

>>> im = ax.imshow(img, cmap='seismic')

Markers

>>> fig, ax = plt.subplots()

>>> ax.scatter(x,y,marker=".")

>>> ax.plot(x,y,marker="o")

Linestyles

>>> plt.plot(x,y,linewidth=4.0)

>>> plt.plot(x,y,ls='solid') >>> plt.plot(x,y,ls='--')

>>> plt.plot(x,y,'--',x**2,y**2,'-.')

>>> plt.setp(lines,color='r',linewidth=4.0)

Text & Annotations

>>> ax.text(1,

-2.1, 'Example Graph', style='italic')

>>> ax.annotate("Sine", xy=(8, 0), xycoords='data' xytext=(10.5.0). textcoords='c

arrowprops=dict(arrowstyle="connectionstyle="arc3").)

Mathtext

>>> plt.title(r'\$sigma_i=15\$', fontsize=20)

Limits, Legends & Lavouts

Limits & Autoscaling

>>> ax.margins(x=0.0,y=0.1)

Add padding to a plot

>>> ax.axis('equal') Set the aspect ratio

>>> ax.set(xlim=[0,10.5],ylim=[-1.5,1.5]) Set limits for x-and v-axis

>>> ax.set xlim(0,10.5) Set limits for x-axis

>>> ax.set(title='An Example Axes'. ylabel=

xlabel='X-Axis' >>> ax.legend(loc='best')

No overlapping plot elements

Set a title and x-and

>>> ax.xaxis.set(ticks=range(1,5), ticklabels=[3,100,-12,"foo"]) direction=

Manually set x-ticks

Make y-ticks longer and go in and out

Subplot Spacing

>>> fig3.subplots adjust(wspace=0.5 hspace=0.3 left=0.125. right=0.9, top=0.9,

>>> fig.tight_layout()

Axis Spines

>>> ax1.spines['top'=].set visible(False)

Make the top axis line for a plot invisible

>>> ax1.spines['bottom'].set_position(('outward',10))

bottom=0.1

Move the hottom

Plotting Routines

1D Data

>>> lines = ax plot(x v) >>> ax.scatter(x.v)

>>> axes[0,0].bar([1,2,3],[3,4,5])

>>> axes[1.0].barh([0.5.1.2.5].[0.1.2])

>>> axes[1,1].axhline(0.45) >>> axes[0,1].axvline(0.65)

>>> ax.fill(x,y,color='blue')

Draw unconnected points, scaled or colored Plot vertical rectangles (constant width) Plot horiontal rectangles (constant height) Draw a horizontal line across axes

Draw points with lines or markers connecting them

Draw a vertical line across axes Draw filled polygons

>>> ax.fill_between(x,y,color='yellow')
2D Data Fill between y-values and 0 >>> fig. ax = plt.subplots() Colormapped or RGB

>>> im = ax.imshow(img arrays cmap='gist_earth', interpolation='nearest', vmin=-2

Vector Fields

>>> axes[0.1].arrow(0.0.0.5.0.5) >>> axes[1,1].quiver(y,z) >>> axes[0,1].streamplot(X,Y,U,V) Add an arrow to the axes Plot a 2D field of arrows Plot 2D vector fields

Data Distributions

>>> ax1.hist(y) >>> ax3.boxplot(v) >>> ax3.violinplot(z) >>> axes2[0].pcolor(data2)

>>> axes2[0].pcolormesh(data)

>>> CS = plt.contour(Y,X,U)

>>> axes2[2].contourf(data1)

>>> axes2[2]= ax.clabel(CS)

Make a box and whisker plot Make a violin plot Pseudocolor plot of 2D array

Pseudocolor plot of 2D array

Plot contours Plot filled contours Label a contour plot

Plot a histogram

Close & Clear

Save Plot

Save figures

>>> plt.savefig('foo.png')

Show Plot

Save transparent figures

>>> plt.savefig('foo.png', transparent=True)

>>> plt.cla()

>>> plt.show()

>>> plt.clf() >>> plt.close()

Data Visualisation with applot2 **Cheat Sheet**

Basics

ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same few components: a data set, a set of geoms-visual marks that represent data points, and a coordinate system

To display data values, man variables in the data set to aesthetic properties of the geom like size color, and x and y locations

Build a graph with qplot() or qqplot()

qplot(x = cty, y = hwy, color = cyl, data = mpg, geom = "point")

Creates a complete plot with given data, geom, and mappings. Supplies many useful defaults.

ggplot(data = mpg, aes(x = cty, y = hwy))

Begins a plot that you finish by adding layers to. No defaults, but provides more control than gplot().

ggplot(mpg, aes(hwy, cty)) +

geom point(aes(color = cvl)) + geom_smooth(method ="lm") + coord cartesian() + scale color gradient() -

Add a new layer to a plot with a geom_*() or stat_*() function. Each provides a geom, a set of aesthetic mappings, and a default stat and position adjustment.

last plot()

theme bw()

Returns the last plot

ggsave("plot.png", width = 5, height = 5)

Saves last plot as 5' x 5' file named "plot.png" in working directory. Matches file type to file extension.

Coordinate Systems

r <- b + geo m_bar()

Cartesian coordinates with fixed aspect ratio between x and y units

coord_flip()

+ coord polar(theta = "x". direction=1)

xtrans, ytrans, timx, timy Transformed cartesian coordinates. Set extras and strains to the name

+ coord map(projection = "ortho" + coord_maptprojection = ortho, orientation=c(41, -74, 0)) projection, orientation, xlim, ylim Map projections from the mapproj package (mercator (default), azequalarea, lagrange, etc.)

Geom's Use a geom to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer

One Variable

Continuous

geom_histogram(binwidth = 5)

Graphical Primitives

1 + geom_ribbon(aes(ymin=unemploy - 900, ymax=unemploy + 900)) x, ymax, ymin, alpha, color, fill, linetype, size

+ geom_segment(aes(

xend = long + delta_long, yend = lat + delta_lat)) xend, v. vend, alpha, color, linetype, size + geom_rect(aes(xmin = long, ymin = lat,

xmax= long + delta_long, ymax = lat + delta_lat))

Three Variables

seals\$z <- with(seals, sqrt(delta_long^2 + delta_lat^2))
m <- qqplot(seals, aes(long, lat))</pre>

+ geom_contour(aes(z = z))

geom_raster(aes(fill = z), hjust=0.5, st=0.5, interpolate=FALSE)

geom_tile(aes(fill = z))

Faceting

Facets divide a nlot into subplots based on the values of one or more discrete variables.

+ facet_grid(vear ~ .)

+ facet_grid(year ~ fl)

t + facet_wrap(~ fl)

Set erales to let avis limits vary across facets et_grid(y ~ x, scales = "free")

x and v axis limits adjust to individual facets

"free_x" - x axis limits adjust "free_y" - y axis limits adjust

Set labeller to adjust facet labels

t + facet grid(~ fl labeller = label both) fl:c fl:d fl:e fl:p fl:r rid(. ~ fl, labeller = label both) α^c α^d α^e α^p α^r

t + facet_grid(. ~ fl, labeller = label_both) c d e p r

Two Variables

Continuous X. Continuous Y

Discrete X, Continuous Y

g <- ggplot(mpg, aes(class, hwy))

geom_bar(stat = "identity")

geom_violin(scale = "area")

Discrete X, Discrete Y

geom_jitter()

Continuous Bivariate Distribution

geom_bin2d(binwidth = c(5, 0.5))

geom_density2d()

geom_hex()

Continuous Function

geom_step(direction = "hv")

df <- data.frame(grp = c("A", "B"), fit = 4:5, se = 1:2)

geom_pointrange()

+ geom_map(aes(map_id = state), map = map) +
expand_limits(x = map\$long, y = map\$lat)
x x alpha color fill linetyne size

Position Adjustments

Position adjustments determine how to arrange geoms that would otherwise occupy the same space

s <- ggplot(mpg, aes(fl. fill = drv))

s + geom_bar(position = "dodge")
Arrange elements side by side

s + geom_bar(position = "fill")
Stack elements on ton of one another norm

geom_bar(position = "stack")

f + geom_point(position = "jitter")
Add random noise to X and Y position of each element to avoid overplotting

Each position adjustment can be recast as a function with manual width and height arguments

colorbar, legend, or none (no legend)

s + geom_bar(position = position_dodge(width = 1))

Labels

t + xlab("New X label") Change the label on the X axis

t + ylab("New Y label") Change the label on the Y axis

Leaends

guides(color = "none")

t + labs(title =" New title", x = "New x", y = "New y")
All of the above

t + scale_fill_discrete(name = "Title", labels = c("A", "B", "C"))

theme(legend.position = "bottom")

Use scale functions to update legend

Themes

f + stat_unique()

f + stat identity()

f + stat sum()

dparams = list(df=5))

Stats An alternative way to build a layer

e.q. a + geom_bar(stat = "bin")

FMA

fl cty ctl

Some plots visualize a transformation of the original data set

Each stat creates additional variables to map aesthetics to. These

variables use a common ..name.. syntax. stat functions and geom

functions both combine a stat with a geom to make a layer, i.e.

i + stat_density2d(aes(fill = ..level..), geom = "polygon", n = 100)

a + stat_bin(binwidth = 1, origin = 10)

f + stat_bin2d(bins = 30, drop = TRUE)

f + stat binhex(bins = 30)

m + stat contour(aes(z = z))

+ stat_boxplot(coef = 1.5)

stat ecdf(n = 40)

+ stat ecdf(n = 40)

+ stat_bindot(binwidth = 1, binaxis = "x")

f + stat_density2d(contour = TRUE, n = 100)

m+ stat_spoke(aes(radius= z, angle = z))

ggplot() + stat_function(aes(x = -3:3), fun = dnorm, n = 101, args = list(sd=0.5))

f + stat summary(fun.data = "mean cl boot")

m + stat_summary_hex(aes(z = z), bins = 30, fun = mean)

g + stat_ydensity(adjust = 1, kernel = "gaussian", scale = "area")

stat_quantile(quantiles = c(0.25, 0.5, 0.75), formula = $y \sim log(x)$,

f + stat_smooth(method = "auto", formula = y ~ x, se = TRUE, n = 80, fullrange = FALSE, level = 1,95) x,y1.se, x, y1.se, x, y1

 $f + stat_quantile(quantiles = c(0.25, 0.5, 0.75), formula = y \sim log(x),$

f + stat _smooth(method = "auto", formula = y ~ x, se = TRUE, n = 80, fullrange = FALSE, level = 0.95) xyl_se_x_y___mn___man__

ggplot() + stat_qq(aes(sample=1:100), distribution = qt,

a + stat_density(adjust = 1, kernel = "gaussian")

stat_bin(geom="bar") does the same as geom_bar(stat="bin")

Use a stat to choose a common transformation to visualize.

r + theme arev()

+ theme_minimal()

ggthemes - Package with additional ggplot2 themes

Scales

Scales control how a plot mans data values to the visual values of an aesthetic. To change the mapping, add a ustom scale.

n <- b + geom_bar(aes(fill = fl))

n + scale fill manual(

values = c("skyblue", "royalblue". "blue". "navv") limits = c("d", "e", "n", "r"), breaks =c("d", "e", "n", "r") name = "fuel", labels = c("D", "E", "P", "R"))

General Purpose scales

scale_*_continuous() - map cont' values to visual values scale_*_discrete() - map discrete values to visual values scale_*_identity() - use data values as visual values scale_*_manual(values = c()) - map discrete values to

X and Y location scales

scale_x_date(labels = date_format("%m/%d"),

breaks = date breaks("2 weeks")) scale_x_datetime() - treat x values as date times. Use

scale_x_log10() - Plot x on log10 scale scale_x_reverse() - Reverse direction of x axis

scale x sqrt() - Plot x on square root scale Color and fill scales

n + scale fill brewer palette = "Blues") For palette choices:

colours = terrain.colors(6)) Also: rainbow(), heat.colors(), topo.colors(), cm.colors(), RColorBrewer::brewer.pal()

<- a + geom_dotplot(

aes(shape = fl))

0 □ 6 ▽ 12 ⊞ 18 ◆ 24 ▲ 1 ○ 7 🛛 13 🔯 19 • 25 🔻 2 △ 8 ★ 14 四 20 • • • 3 + 9 ◆ 15 ■ 21 ○ p + scale_shape_manual(values = c(3:7)) 4 × 10 ⊕ 16 ● 22 ■ 0 0

5♦ 11 🕱 17 🛦 23 ♦ 0 O

Zooming

Without clipping (preferred)

t + coord cartesian(xlim = c(0, 100), ylim = c(10, 20)

With clipping (removes unseen data points)

t + xlim(0, 100) + ylim(10, 20)

scale_x_continuous(limits = c(0, 100)) + scale_y_continuous(limits = c(0, 100))
